◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Approximate Distance Oracles — Stretch

- Distance between u and v in graph G: $d_G(u, v)$
- Oracle Result $\tilde{d}(u, v)$ satisfies

$$d_G(u,v) \leqslant \widetilde{d}(u,v) \leqslant \alpha \cdot d_G(u,v) + \beta.$$

- Stretch (α, β)
 - Multiplicative Stretch α
 - * Additive Stretch β

Practical

Focus on Transportation Networks

Theoretical

- ✤ General, undirected graphs
- Restricted classes (planar, bounded tree-width, minor-closed,...)

Shortest Path Queries in Transportation Networks

- Main focus, large body of research since 60's/70's
- Big progress around 2006 (DIMACS Implementation Challenge)
 - \clubsuit Preprocessing: tens of minutes for road map of the US/EU
 - $\clubsuit\,$ Query time: $\approx 10^6$ times faster than Dijkstra's algorithm
- Ideas
 - ✤ Geometry, coordinates, A* search [SV86]
 - ✤ Goal-directed search (A* for graphs) [GH05]
 - ✤ Hierarchical structures [SS05, BFSS07, BD08, BDS⁺08]
- Heuristics that work very well for road networks (often need separators)

Practical

Focus on Transportation Networks

Theoretical

 General, undirected graphs — unweighted if not stated otherwise

	$n^{1+\Omega(1/t)}$	t	< (1,2)	thesis/[Pat08]
	$n^{1+\Omega(1/lpha t)}$	t	$\leq (\alpha, 0)$	this thesis

Comparison with Related Work — "Hard" Graphs

- ★ "hard" graphs in Thorup and Zwick's lower bound have average degree Θ $(n^{2/\alpha})$ → very dense TZ actually prove space Ω(m)
- This proof: regular graphs with degree

$$\Theta\left(\left(\frac{\operatorname{8tw}\alpha}{\lg n}\right)^{2/\mathsf{C}}\right) \leqslant \operatorname{polylog}(n)$$

- query time t
- \clubsuit word length w
- (multiplicative) stretch α

* constant
$$C \in [0, 1]$$

proves space $\omega(m)$

 Distance oracles for sparse graphs also require large space: Before: Ω(n · polylog(n)) Now: Ω(n^{1+ϵ})

Proof Idea

✤ Reduction from Distance Oracle to a Communication Protocol

- This Protocol efficiently solves the LOPSIDEDSETDISJOINTNESS Problem from Communication Complexity
- But: There is a Communication Lower Bound for the LOPSIDEDSETDISJOINTNESS Problem

"Hard" Graphs

Expander Graphs [LPS88]

- ✤ n nodes, degree $\Theta\left(\left(\frac{8tw\alpha}{\lg n}\right)^{2/C}\right) \leq polylog(n)$
- girth $\mathcal{O}(\lg n)$ (girth: length of shortest cycle)
- * many disjoint paths ($\approx \alpha$ times shorter than the girth)
- Distance oracle for sparse graphs must be able to handle expander graphs and all their subgraphs
- (α , 0)-approximate distance oracle must handle distance queries in time t

• (in particular for the endpoints of these paths \uparrow)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

$$S_{\text{Alice}} \cap S_{\text{Bob}} \stackrel{?}{=} \emptyset$$

Path Queries and the Girth - not "too long" paths

 query d_{G'}(u, v) for a shortest path from u to v in G
 (path not "too long")

 ~→ decide whether the path is contained in G'

$$S_{\text{Alice}} \cap S_{\text{Bob}} \stackrel{?}{=} \emptyset$$
